Why this report?

• It is a disgrace that so many mothers and children remain excluded from the care they need and demand.
• The consequences are often fatal, and progress is too slow and too patchy.
• More can and should be done.
Contents

Part 1. The situation in 2005
  - Mothers and children matter – so does their health
  - Obstacles to progress: context or policy?

Part 2. Programme strategies
  - Great expectations: making pregnancy safer
  - Attending to 136 million births, every year
  - Newborns: no longer going unnoticed
  - Redesigning child care: survival, growth and development

Part 3. System and policy implications
  - Reconciling maternal, newborn and child health with health system development
1. The situation in 2005
This year

- Almost **11 million children under 5** will die, mostly from a handful of causes.
- **4 million of these** will die within 28 days of birth.
- **3.3 million babies** will be stillborn.
- **½ million women** will die in pregnancy, during childbirth, or afterwards.
Evolution of maternal and child health

- For centuries regarded as a domestic affair.
- Became a public health priority in the 20th century.
- Increasing role of the state. National approaches, with international influence.
- Today, a moral and political imperative:
  - mother and child care seen as an entitlement …
  - … improving it is vital to increase equity and reduce poverty.
Progress is slowing down …
... and is unequally distributed

Child mortality

• **93 countries** (40% of world's population): on track towards 2/3 reduction by 2015 (MDG4).

• **51 countries** (48%): slow progress.

• **43 countries** (12%): stagnation or reversal.
Similar patterns for newborn mortality …
... and for maternal mortality

World Health Organization
April 05
Maternal mortality

- Little improvement.
- Pregnancy and childbirth are still the leading causes of death and disease in women of reproductive age in developing countries.
- Over 300 million women in developing countries suffer from illness due to pregnancy, abortion, childbirth; 529 000 die each year.
- Lifetime risk of maternal death: Africa, 1 in 16; rich countries, 1 in 2800.
New awareness of the plight of newborns

• Newborn mortality has long been underestimated:
  - 40% of under-five deaths occur in the first month;
  - 98% of these deaths happen in developing countries.
• 3.3 million stillbirths every year.
• The gap between rich and poor is widening.
Unequal progress in reducing neonatal mortality between 1995 and 2000

World Health Organization

- **Brazil 1996**
- **Marginalization**
- **Massive deprivation**
- **Ethiopia 2000**

- ≥ 4 antenatal care visits
- Birth in a health facility
- Skilled attendance at birth
2. Programme strategies
The two meanings of "continuum of care"

- A continuum that spans life's beginnings:
  - from before conception to childhood through pregnancy, childbirth and infancy.
- A continuum that goes from:
  - the home (empowering families);
  - through the health centre (bringing care closer to home);
  - and, when needed, to the hospital (facilitating referral).
Great expectations: making pregnancy safer

The most important things to do

• Prevent unwanted pregnancies.
• Tackle the public health priority of unsafe abortions.
• Provide antenatal care to improve the health of mother and baby.
• Provide social support and legal protection.
Not every pregnancy is welcome

- 87 million unintended pregnancies per year.
- 46 million induced abortions per year.
- More than 18 million in unsafe circumstances, leading to 68,000 deaths, countless disabilities and untold suffering.

- Invest in education, information and contraceptive services.
- Guarantee access, to fullest extent permitted by law, to good-quality and responsive abortion and post-abortion care.
Antenatal care is a success story: uptake and demand are on the increase.
Antenatal care is also a platform

- For other programmes: nutrition, HIV/AIDS, sexually transmitted infections, malaria, tuberculosis.
- For promoting healthy lifestyles and breastfeeding.
- For establishing a birth plan.
- For improving parenting skills.
- For stronger links between mothers and health services during and after childbirth.
Complications of childbirth

• Complications cannot be predicted: all mothers must be attended.

• Midwives and other professionals with midwifery skills can avert, contain or solve many of the life-threatening problems that may arise during childbirth – but they need the back-up of a hospital.
Skilled attendance at birth saves mothers and babies
Neonatal mortality is lower when mothers benefit from antenatal and childbirth care

Data source: Demographic and Health Surveys.
Newborn care

- Pregnancy care.
- Skilled care at birth.
- Care for newborns with complications.
- Parenting skills and care in the home.
- Bridging the handover between maternal and child health services.
# First-level and back-up care

<table>
<thead>
<tr>
<th></th>
<th>First-level maternal and newborn care</th>
<th>Back-up maternal and newborn care</th>
</tr>
</thead>
<tbody>
<tr>
<td>Defining feature</td>
<td>Close to client: demedicalized and with respect for birthing cultures, but provided by professionals</td>
<td>Referral-level technical platform to deal with surgical and other complications</td>
</tr>
<tr>
<td>For whom?</td>
<td>For all mothers and newborns</td>
<td>For mothers and newborns who present problems that cannot be solved by first-level care</td>
</tr>
<tr>
<td>By whom?</td>
<td>Best by midwives: alternatively by doctors or by doctors and nurses if correctly trained and skilled</td>
<td>By a team that includes gynaecologists-obstetricians and paediatricians; alternatively by appropriately trained doctors or mid-level technicians</td>
</tr>
<tr>
<td>Where?</td>
<td>Preferably in midwife-led facilities: also in all hospitals with maternity services</td>
<td>In all hospitals</td>
</tr>
</tbody>
</table>

Scaling up coverage of maternal and newborn health care and services will cost

- US$ 39 billion over 10 years, in addition to current health expenditure on maternal and newborn health.
- US$ 1 billion in 2006; increasing to US$ 6.1 billion in 2015.
- An additional US$ 0.22 per inhabitant per year initially, expanding to US$ 1.18 in 2015.
Cost, additional to current expenditure, of moving towards universal coverage
Redesigning child care: survival, growth and development

- Single-issue programmes: great successes, great limitations (examples: EPI, ORT).
- Shift in focus now from diseases to children.
- Increased recognition of power of family actions and care for development.
- Move towards integration: of interventions and service delivery.
What do children die of today?

- Most deaths are due to a handful of conditions.
- Causes vary among regions.
- Effective, affordable interventions: available, but coverage too low.
- Need to move towards universal access to meet MDG4.

*a* Totals are more than 100% due to rounding.
Integrated Management of Childhood Illness (IMCI): a viable strategy

• Simple set of affordable, effective interventions that addresses main killers plus developmental needs.
• Integration at three levels of care (patient, point of delivery, system).
• Improves health worker skills, health system support, counselling and problem solving.
• Builds partnerships between parents and health workers to empower families.
Proportion of districts where training and system strengthening for IMCI had begun by 2003a
Scaling up coverage of child health interventions will cost

- US$ 52 billion over 10 years, in addition to current child health expenditure.
- US$ 2 billion in 2006; increasing to US$ 8 billion in 2015.
- An extra outlay of around US$ 0.47 per inhabitant per year initially, expanding to US$ 1.48 in 2015.
- Single greatest cost: human resources.
Cost of scaling up child health interventions to full coverage, additional to current expenditure

- 21 countries with major constraints, long lead time
- 23 countries with fewer constraints, short lead time
- 18 countries that require no lead time
- 13 countries whose health systems allow for rapid scale up
- All countries
3. System and policy implications
Reconciling MNCH with health systems development

• Strategies that cross boundaries between maternal, newborn and child programmes.
• Synergies between MNCH programmes and environmental protection, gender equality and poverty reduction.
• Links between MNCH programmes and core health systems development processes with investment plans that:
  - overcome the systemic constraints on scaling up;
  - embed MNCH in an overriding project of ensuring universal coverage.
Universal coverage

• Universal access requires:
  - sufficient supply of services;
  - no financial barriers to uptake of services.

• Protection against financial consequences:
  - more than 100 million individuals in the world each year are pushed into poverty as a result of spending money on health care.
Organizing the financing of the health sector for universal coverage

- Shift from user fees to pre-payment and pooling.
- Consider all sources of funding:
  - Both domestic and international funding;
  - Need for increased public spending.
- Start to build national health insurance schemes (tax-based, social health insurance, mixed systems) from very early stage:
  - to develop institutional capacity;
  - to make funding more predictable and sustained.
- Keep MNCH at core of package of benefits.
The human resources crisis

- Shortages after years of insufficient production, downsizing, caps on recruitment, frozen salaries, losses to migration and HIV/AIDS, social and economic crises.
- Skill-mix mismatch.

Source: Adapted from The Unmet Obstetric Need Network (http://www.itg.be/uorn/).
Making up for the shortages

• In the next 10 years, 75 countries need:
  - at least 334 000 additional midwives (or professionals with midwifery skills);
  - upgrading of 140 000 existing professionals providing first-level care;
  - upgrading of 27 000 doctors and technicians to provide back-up care;
  - deployment of 100 000 multipurpose professionals backed up by millions of community health workers, plus specialized referral-level personnel to scale up child health care activities.
The human resources crisis is not just a question of numbers

- Inadequate pay and crisis of morale:
  - dual practice;
  - predatory behaviour.
- Fuels exclusion (diminishes trust).
- HRH fraction of scale-up costs (US$ 35 billion) needs to be multiplied by factor ??.
- Take immediate corrective measures.
Rehabilitating the workforce

- Prevent further harm – limit donor-related destabilization.
- Planned expansion of the workforce on the basis of a political consensus.
- Pool funding flows to ensure more sustained and predictable financing.
- Make the human resources crisis a national and global priority.
The report comes with a set of policy briefs to help prepare next steps.
A political agenda

• Build national consensus with:
  - mechanisms for predictable, sustained and increased funding;
  - MNCH at core of health entitlements;
  - human resources as national priority.

• Partnerships with civil society:
  - to establish accountability mechanisms;
  - to maintain political momentum.

• Accelerate scale-up towards universal coverage.

• WHR 2006 on human resources for health.
